                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ۵
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cutoff, using GibcoBRL Life Technologies' cDNA Size | Fractionation column. The column eluent was then precipitated, redissolved, and ligated into Stratagene's pBluescript II XR predigested vector (pBluescript II SK(+) vector that has been digested with EcoRI and XhoI, and phosphorylated by Stratagene). 100% of the white and 87.5% of the blue colonies appear to contain recombinant plasmids with cDNA inserts, based on size (n=28 and 8 respectively). This library was constructed by Dr. Paul Keim and Dr. Virginia Coryell."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4.0%;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Inote "Vector: lambda Zip-Lox; Site_1: Sal; Site_2: Not; Lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) 7 day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark-rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and sliques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dT primed cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           oligo dT primed cDNA.

                                                                                                                                                                                                                         library was derived from untreated root tissue from Arabidopsis thaliana, Columbia Col-0, at 4 - 7 weeks. Plants were grown in 1:1:1 peat moss/vermiculite/perlite soil at 22 deg. C +/- 3 deg. C under constant light, and watered with fertilizer. cDNA synthesis was initiated using a NotI-oligo(dT) primer. Double-stranded cDNA was blunted, ligated to SalI adaptors, digested with NotI, size-selected, and cloned into the NotI and SalI sites of the pSPORT vector."

//tissuc_type="root tips"
//dev_stage="harvested after 3 days of N-starvation"
//note="Vector: pBluescript pSK; Site_1: EcoRI; Site_2:
XhoI; PLAnts were grown in an aeroponic chamber for 14
days on nitrogen-rich medium followed by 3 days on N-free
medium. RNA was extracted from root tips (1-3 cm). cDNA
was prepared from polyA+ enriched RNA. The cDNA was
directionally ligated into Uni-zapXR vector from
Stratagene and packaged using Gigapack Gold packaging
extracts. Plasmids containing cDNA inserts were
mass-excised from phage stocks using ExAssit helper phage
and propagated in SOLR cells. Clone ordering and
sequencing was performed by the Centre National de
Sequencage (Genoscope, Evry, France)."
                                                                                                                                                                                                                                                                                                                                                                     280 bp mRNA EST 12-
RIKEN full-length enriched, 10 days neonate
cDNA clone B930056M08 3', mRNA sequence.

CC A host cell containing a vector comprising a nucleotide sequence

CC encoding N-SMase can be used to produce N-SMase. N-SMase can be used in

CC a method for identifying a compound useful in the diagnosis or treatment

CC of a human neutral sphingomyelinase related disorder. N-SMase, and a

CC nucleotide sequence encoding N-SMase, can be used for modulating N-SMase

CC caltvity, and for treating a disorder associated with N-SMase. The

CC N-SMase disorders that can be treated with the nucleotide sequence or

CC N-SMase, is an inflammatory disorder, arthritis, osteoarthritis, Crohn's

CC disease, obesity, diabetes, cirrhosis, susceptible tumours, central

CC nervous system disorder, vascular restenosis, arterial occlusion arising

CC from plaque formation, cardiac disease where LV dysfunction occurs,

CC hypercholesterolaemia, cholesteryl ester storage disorder, renal failure,

CC HIV infection, depression, schizophrenia, neurodegeneration, and

CC Alzheimer's disease. An antibody against N-SMase can be used to reduce

CC cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Вþ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel method for the induction of pathogen cresistance in plants, by transformation with an expression cassette harboring a gene coding for an isochorismate synthase (ICS). A pathogen inducible promoter can be used to drive expression of a heterologous protein. The heterologous protein used in the method of the invention is an antipathogenic protein e.g. chitinase, glucanase, osmotin, lectins, saccharide oxidase, oxalate oxidase, magainins, toxins from Bacillus thuringiensis, or antifungal proteins isolated from Mirabilis jalapa, Amaranthus, Raphanus, Brassica, Sinapis, Arabidopsis, Dahlia, Cnicus, Lathyrus, Clitoria, Allium seeds, Aralia and Impatiens and albumin-type proteins, such as thionine, napin, barley trypsin inhibitor, cereal plantanes, such as Cf, Bs3 and Po proteins from tomato and hypersensitive response, such as Cf, Bs3 and Po proteins from tomato and such as those of the protein that can induce a hypersensitive response, such as Cf, Bs3 and Po proteins from tomato and such as the content of the cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel method for the induction of pathogen cresistance in plants, by transformation with an expression cassette harboring a gene coding for an isochorismate synthase (ICS). A pathogen charboring a gene coding for an isochorismate synthase (ICS). A pathogen inducible promoter can be used to drive expression of a heterologous protein. The heterologous protein used in the method of the invention is antipathogenic protein e.g. chitinase, glucanase, osmotin, lectins, cascharide oxidase, oxalate oxidase, magainins, toxins from Bacillus saccharide oxidase, oxalate oxidase, magainins, toxins from Bacillus, thuringiensis, or antifungal proteins isolated from Mirabilis jalapa, amaranthus, Raphanus, Brassica, Sinapis, Arabidopsis, Dahlia, Cnicus, Camarinthus, Raphanus, Brassica, Sinapis, Arabidopsis, Dahlia, Cnicus, Clathyrus, Clitoria, Allium seeds, Aralia and Impattiens and albumin type proteins, such as thionine, napin, barley trypsin inhibitor, cereal gladin and wheat-alpha-amylase, or a protein that can induce a hypersensitive response, such as Cf, Bs3 and Po proteins from tomato and N-protein from tobacco. This sequence represents the Escherichia coli isochorismate synthase entC gene which is described in the method of
                                                                                                                                                          Query Match

```

This invention describes a novel method for the induction of pathogen resistance in plants, by transformation with an expression cassette harboring a gene coding for an isochorismate synthase (ICS). A pathogen inducible promoter can be used to drive expression of a heterologous protein. The heterologous protein used in the method of the invention is an antipathogenic protein e.g. chitinase, glucanase, osmotin, lectins, as a natipathogenic protein e.g. chitinase, glucanase, osmotin, lectins,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC Inducible promoter can be used to drive expression of a heterologous conducible promoter can be used to drive expression of a heterologous conducible promoter can be used to drive expression of a heterologous conducible promoter can be used to drive expression of a heterologous contains. The heterologous protein used in the method of the invention is contained exidase, oxalate exidase, magainins, toxins from Bacillus thuringiensis, or antifungal proteins isolated from Mirabilis jalapa, containingiensis, or antifungal proteins isolated from Mirabilis jalapa, containingiensis, or antifungal proteins isolated from Mirabilis jalapa, containingiensis, or antifungal proteins solated from Mirabilis jalapa, containingiensis, or antifungal proteins solated from Mirabilis jalapa, containingiensis, containingiensis, Arabidopsis, Dahlia, Cnicus, containingiensis, Allium seeds, Arabid and Impatiens and albumin type proteins, such as thionine, napin, barley trypsin inhibitor, cereal contains, such as thionine and the protein that can induce a hypersensitive response, such as Cf, Bs3 and po proteins from tomato and Contain from tobacco. This sequence represents the Pseudomonas contains and such as Sochorismate swithers orfa norfain which is decorated in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

A pathogen inducible promoter can be used to drive expression of a heterologous protein used in the method of the invention is an antipathogenic protein e.g. chitinase, glucanase, osmotin, lectins, saccharide oxidase, oxalate oxidase, magainins, toxins from Bacillus thuringlensis, or antifungal proteins isolated from Mirabilis jalapa, Amaranthus, Raphanus, Brassica, Sinapis, Arabidopsis, Dahlia, Cnicus, Lathyrus, Clitoria, Allium seeds, Aralia and Impattens and albumin-type proteins, such as thionine, napin, barley trypsin inhibitor, cereal gliadin and wheat-alpha-amylase, or a protein that can induce a hypersensitive response, such as Cf. Bs3 and Po proteins from tomato and Protein in from tobacco. This sequence represents a Pseudomonas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (MOGE-)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         N-PSDB;

                                                                                                                                                                                                                                                                                                                                                                       This sequence corresponds to the tobacco (Nicotiana tabacum) anthranilate synthase ASA1. The corresponding gene's promoter and DNA constructs containing it are useful for imparting, to a plant cell, tolerance to an amino acid analogue of Trp, or altering the Trp content in a plant by transforming the plant cells with an expression cassette containing the ASA2 structural gene. The promoter and construct are useful for the production of transgenic plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US5965727-A.

SXCCCCCCCCCCCCCCCCCCCCCX by proving a superior of the superior
                                                                                                                                                                                                                           The present invention describes isolated anthranilate synthase alpha-
CC subunit (ASAS), anthranilate synthase beta-subunit (ASBS), and tryptophan
CC synthase alpha-subunit (TSAS) nucleic acids, and protein encoded by them,
CC obtained from corn, rice, Soybean and wheat cDNA libraries. The nucleic
CC acid fragments may be used to create transgenic plants in which the
CC disclosed ASAS, ASBS or TSAS are present at higher or lower levels than
CC normal or in cell types or developmental stages in which they are not
CC normally found. This would have the effect of altering the level of
CC tryptophan in those cells. Manipulation of the levels of some of the
CC ASASs will also results in changes in the response to pathogen attack.
CC Because this pathway is not followed for the production of tryptophan in
CC higher animals, these enzymes are very good candidates for the discovery
CC of herbicides and fungicides. The ASAS, ASBS or TSAS can be used as
CC targets to facilitate design and/or identification of inhibitors of those
CC enzymes that may be useful as herbicides. Nucleic acid fragments can also
CC to used as probes for genetically and physically mapping the genes that
CC they are a part of, and as markers for traits linked to those genes. Such
CC with desired phenotypes. Z25109 to Z25127 represent specifically claimed
CC nucleic acids from the present invention and Y42112 to Y42130 represent

                                    nthase ASA2. The corresponding gene's promoter and DNA constructs ntaining it are useful for imparting, to a plant cell, tolerance to amino acid analogue of Trp, or altering the Trp content in a plant transforming the plant cells with an expression cassette containing e ASA2 structural gene. The promoter and construct are useful for the oduction of transgenic plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9

                                                                                                                                                                                                                                                                        This invention describes a novel rice anthranilate synthase first isozyme alpha-subunit. The encoding DNA can be used to produce transformant plants and seeds, of e.g. rice, maize or wheat, with enhanced tryptophan content and nutritional value of the crops.
                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA encodes ^a-subunit of first isozyme of rice anthranilate synthase - used for improving tryptophan production and nutritional value of crops, e.g. rice, maize or wheat

      The present invention describes isolated anthranilate synthase alphaces subunit (ASAS), anthranilate synthase beta-subunit (ASBS), and tryptophan cypy synthase alpha-subunit (TSAS) nucleic acids, and protein encoded by them, cobtained from corn, rice, soybean and wheat cDNA libraries. The nucleic acid fragments may be used to create transgenic plants in which the collicity of in cell types or developmental stages in which they are not normal or in cell types or developmental stages in which they are not commally found. This would have the effect of altering the level of tryptophan in those cells. Manipulation of the levels of some of the ASAS will also results in changes in the response to pathogen attack. Because this pathway is not followed for the production of tryptophan in those crimes are very good candidates for the discovery of herbicides and fungicides. The ASAS, ASBS or TSAS can be used as complete that may be useful as herbicides. Nucleably manipulation that can also be used as manipulation and or manipulation of inhibitors of those cargines that may be useful as herbicides. Nucleably manipulation that the constant was also that may be useful as herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   chimeric gene; corn; rice; soybean; wheat; tryptophan biosynthetic enzyme; chimeric gene; corn; rice; soybean; wheat; tryptophan synthase; anthranilate synthase beta subunit; herbicide; fungicide; phenotype; pathogen attack; identification; transgenic plant; ASAS; ASBS; TSAS; plant breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
This protein sequence comprises a maize anthranilate synthase (AS) that is resistant to inhibition by free L-tryptophan or its amino acid analogues. Its amino acid sequence was deduced from a cDNA
                                                                                                             Claim 4; Fig 7; 87pp; English.

Such information may be useful in plant breeding in order to develop lines with desired phenotypes. Z25109 to Z25127 represent specifically claimed nucleic acids from the present invention and Y42112 to Y42130 represent the proteins encoded by them.
                                                                                                                                                                      DNA encoding anthranilate synthase resistant to inhibition by tryptophan - and transformed plants, used e.g. to improve try levels in plants and as marker for cell selection

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               clone (see T91102) obtained from the 5-methyltryptophan-resistant maize cell line C28. Compared with the wild-type AS sequence (see W2686), it contains a single amino acid substitution (Lys for Met-377) at a site implicated in tryptophan feedback sensitivity of the enzyme. The C28 allele AS DAM sequence can be used in claimed methods: (i) to impart tolerance of plants to Trp analogues; (ii) to alter, particularly increase, Trp content of plants, either to increase nutritional value or as source of Trp by extraction; (iii) for production of recombinant AS (used for screening to identify agents that bind to or inhibit it); and (iv) for selection of transformed cells. Transgenic plants containing AS can be used for culture of their cells. The trait of resistance to Trp can be introduced to a wide variety of commercial maize lines.

                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel rice anthranilate synthase first isozyme alpha-subunit. The encoding DNA can be used to produce transformant plants and seeds, of e.g. rice, maize or wheat, with enhanced tryptophan content and nutritional value of the crops.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 1; Page 128-131; 152pp; Japanese.
